***Reasons For Allowance***

The present invention is a method of operating a gas turbine engine with air fractionation means. Combinations comprising gas turbines and air separating or fractioning systems are well known in the art, but none of the references of record show or fairly suggest the claimed method comprising the steps of operating a gas turbine engine on a closed or quasi-closed cycle, using a coarse air fractionating means upstream of a further air fractioning means to provide an oxygen flow to the gas turbine's combustion chamber, and removing excess combustion products from the power cycle. The claimed invention is therefore considered patentable over the prior art.
